Macroscopic Quantum Phenomena in Spintronics Herbert Simanjuntak 2019 Although the discussion is general, this book focuses on the problem of macroscopic quantum phenomena using systems of spintronics. The spintronics considered are ferromagnetic and antiferromagnetic spintronics. To represent the macroscopic quantum phenomena in spintronics, transitions from one state to another of the magnetization of ferromagnetic spintronics are considered the Néel vector of antiferromagnetic spintronics. The authors have studied transitions from a metastable state to a stable one, as well as quantum coherence between two degenerate stable states. Quantum and classical rates of transitions are presented as functions of temperature, magnetic field and the spin-polarized current flowing through the spintronics. With this method, one can immediately observe the effect of the spin-polarized current on the transitions of the magnetization and the Néel vector when comparing the results to those of the earlier ones on magnetic systems that do not have spin-polarized current. Specifically, while dissipations in magnetic system are intrinsic, the book shows that total dissipation in spintronics can be controlled and eliminated by varying the spin-polarized current appropriately. The study of transitions from a metastable state to a more stable one in ferromagnetic spintronics shows that the rate of transitions of the magnetization at low temperatures is low and vanishes at zero temperature, so that the magnetization is relatively more stable than that in ferromagnetic materials without external spin-polarized currents. In the case of antiferromagnetic spintronics, the behavior and characteristics of transitions of the Néel vector is in contrast to those of ferromagnetic spintronics, where the low-temperature rate of transitions of the Néel vector in antiferromagnetic spintronics varies exponentially small in temperature, and is finite and non-vanishing at zero temperature. In addition to the theoretical aspects, the book also discusses experimental and technological aspects that one may obtain. Measurements of the rate of transitions can be used to provide an independent method to determine certain parameters being involved, such as the anisotropy parameter K_c of tetragonal crystals, which is an important parameter but usually difficult to obtain. Eliminating dissipation in ferromagnetic and antiferromagnetic spintronics would be desired so as not to have unnecessary loss of energy. Low rate of transitions corresponds to the initial state being relatively stable. Technologically, the stability of the states of the magnetization and Néel vector in spintronics is important, for example, for memory storage.

Developing Social Equity in Australian Adult Education Pamela Osmond 2021-03-07 Developing Social Equity in Australian Adult Education: Lessons from the Past presents a case study of the trajectory of an Australian adult education program in New South Wales from its humanist, social justice beginnings, through forty years of destruction and change. It identifies the influences and influencers that have directed this change; those that were responsible for the creation of the field in its foundation years, and that were displaced by other, more powerful actors representing the influence of the neoliberal ideology. The story is told largely through archival evidence and the voices of those practitioners who helped shape the discourse and practice of the foundation years, and who were required to respond to constantly changing policies and socio-economic contexts. It discusses some lessons that might be learnt from this history in order that a new set of actors might be mobilised to promote an alternate discourse. This book will appeal to scholars of social justice and adult education, and practitioners involved in adult education.

Macrocosm and MicrocosmRudolf Steiner 1986-09 The human life alternates between the great, external macrocosm and the invisible inner microcosm. Steiner discusses the various paths of self-development that lead across these

thresholds and to the transformation of human soul-forces into spiritual organs of perception. A brief synopsis: behind the tapestry of sensory perceptions; human life between macrocosm and microcosm. The planets and the connection with our sleeping and waking life; consciousness soul, mind soul, and sentient soul. The inner path of the mystic; the cycle of the year; the ability to see through matter; the "greater guardian of the threshold." The natural development of human soul faculties; the "lesser guardian of the threshold"; the sun at midnight; the results of the omission." The Egyptian mysteries of Osiris and Isis; initiation experiences; the Rosicrucian path; mystics of the Middle Ages. Initiation in the "northern mysteries"; the necessity of suppressing the ego; conscious ascent into the macrocosm and the higher worlds; the world of archetypal images. The four spheres of the higher worlds; the threshold of the higher world; forces for developing clairvoyant consciousness in the world of archetypal images. The macrocosm mirrored in the human being; the nervous system as an inner solar system; the image of purified blood and the conquest of our nature in the symbol of the Rose Cross. Spiritual organs of perception and the strengthening powers of sleep; the powers of the heart; the ego viewed from twelve perspectives. Reading the akashic record; the transition from intellectual to intuitive thinking; four-dimensional space; intellectual questions have no meaning in relation to conditions before the intellect itself existed. Human and planetary evolution; adaptation to the different states of Earth's existence; the breath of life process should not be influenced directly unless knowledge has become prayer.

Internal Combustion Engines Institution of Mechanical Engineers 2014-10-10 This book presents the papers from the International Internal Combustion Engines: Performance, fuel economy and emissions held in London, UK. This popular international conference from the Institution of Mechanical Engineers provides a forum for IC engine experts looking closely at the latest developments for personal transport applications, though many of the drivers of change apply to light and heavy-duty and off highway, transport and other sectors. These are exciting times to be working in the IC engine field. With a move towards downsizing, advances in FIE and alternative fuels, new engine architectures and the introduction of Euro 6 in 2014, there are plenty of challenges. The aim remains to reduce both CO2 emissions and the dependence on oil-based fossil fuels whilst meeting the future, more stringent constraints on gaseous and particulate material emissions under EU, North American and Japanese regulations. How will technology developments enhance performance and shape the next generation of designs? The book introduces compression and internal combustion engines' applications, followed by chapters on the challenges faced by alternative fuels and fuel delivery. The remaining chapters explore current and future improvements in combustion, pollution prevention strategies and data comparisons. presents the latest requirements for personal transport applications gives an insight into the technical advances and research going on in the IC Engines field provides the latest developments in compression and spark ignition engines for light and heavy-duty applications, automotive and other markets

Western Technology and Soviet Economic Development 1930-1945 Sutton 1973-10 THIS is the second volume of an empirical study of the relationship between Western technology and entrepreneurship and the economic growth of the Soviet Union. The continuing transfer of skills and technology to the Soviet Union through the medium of foreign firms and engineers in the period 1930 to 1945 can only be characterized as extraordinary. A thorough and systematic search unearthed only two major items--SK-B synthetic rubber and the Ramzin 'once-through' boiler--more than a handful of lesser designs (several aircraft, a machine gun, and a motorless combine) which could also be called the result of Soviet technology; the balance was transferred from the West.

Approaches for Assessing the Economic Competitiveness of Small and Medium Sized Reactors Atomic Energy Agency 2014-04-29 This report was prepared with the following objectives: (i) to assist existing and potential stakeholders in Member States in understanding the economic competitiveness of small and medium sized reactor technologies compared to other energy sources and large reactors (LRs); (ii) to inform available approaches and frameworks to assess the economic competitiveness of advanced SMRs and LR under specific conditions of their application; and (iii) to share knowledge on positive experiences of several Member States that have introduced their energy mix. To make SMRs attractive and competitive, it is necessary to reduce the risk of investment by the technology itself, and by enhancing and incorporating the accumulated experience associated with the implementation of this technology. To satisfy these criteria, it may be necessary to offer those SMR technologies that are currently implemented widely, and already have a track record of success and a developed industrial infrastructure. Newer technologies may need to be deployed first to niche markets in the nuclear power plant supplier countries in order to establish a technological base and related infrastructure prior to offering them to developing countries.

Floating Ocean Platform Ronald N. Kostoff 2003-08-01 In FY 1990, Congress directed the Secretary of the Navy to commission a study by the National Academy of Sciences for the production of an integrated technology plan for the evolution of aircraft carriers in the first half of the twenty-first century. The House-Senate conferees emphasized that the product of this study is to be a technology plan for the evolution of sea bases for the most efficient and economical accommodation of tactical air power in the first half of the twenty-first century". Based on this broad charter of evaluating sea bases, an examination of the floating ocean platform concept was included in the study. The floating platform is a generic description of a large, relatively stationary or slowly mobile, platform that can be positioned

areas of the ocean, and can serve a variety of purposes. The present report was the author's input to the study based on technical analyses, literature reviews and surveys, and discussions/visits with the main groups and org involved in developing the floating ocean platform. All discussion material was unclassified, as are the contents of the report. All the external inputs and discussions, too numerous to mention, made this report possible, and are greatly appreciated. The first part of this report is the summary narrative that was submitted by the author to the Technology Group of the study. The second part is the viewgraphs that were presented to the Technology Group by the author in February 1991. The third part is a selected bibliography of studies on the floating ocean platform over the past several decades, with over three thousand references identified.
